

Don't Miss a Teachable Moment!

In today's continuously connected world, information and training can rapidly become obsolete. Keeping up to speed on products, policies, and procedures is a monumental task.

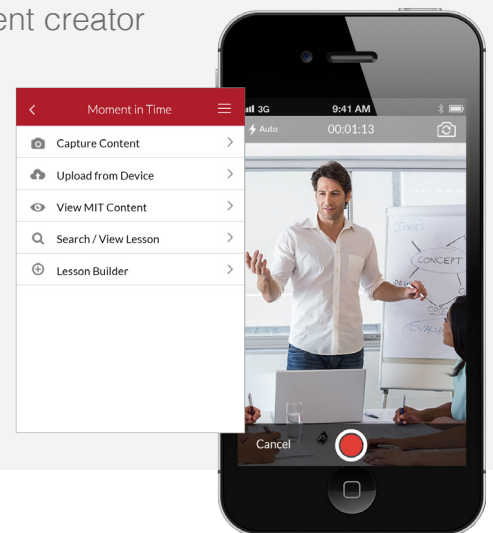

Real-Time Learning

CD2 Learning's patent-pending Moment-in-Time (MIT) application transforms any event into a real-time learning opportunity. Users quickly create and share lessons and activities - anytime, anywhere and from any device. Allow all employees to be a part of creating and capturing content. For example, want to spark discussion on a timely news article or share a dynamic presentation your colleagues may have missed? This capability encourages users to be more active and in their learning journey by generating content and/or participating in the interactive discussions. MIT's reporting system ensures participants have viewed and completed the lesson or activity.

Take advantage of the audio/video capabilities of mobile and desktop devices to:

- Update users on new products/procedures, supporting a culture of continuous learning
- Leverage teachable moments with MIT's real-time content creator
- Offer training and activities in bite-size chunks
- "Flip the classroom" to enhance learning
- Maintain individual libraries of content
- Track content created using a mobile device via geolocation and time stamps
